4. Experimental Results
5. Conclusion

Introduction

- Spatial databases mainly store:
 - Raster data (satellite/aerial digital images), and
 - Vector data (points, lines, polygons).
- Traditional sequential computing models may take excessive time to process large and complex spatial repositories.
- Emerging parallel computing models, such as MapReduce, provide a potential for scaling data processing in spatial applications.

Introduction (cont.)

- MapReduce is an emerging massively parallel computing model (Google) composed of two functions:
 - Map: takes a key/value pair, executes some computation, and emits a set of intermediate key/value pairs as output.
 - Reduce: merges its intermediate values, executes some computation on them, and emits the final output.
- Here we present our experiences in applying the MapReduce model to:
 - Bulk-construct R-Trees (vector)
 - Compute aerial image quality (raster)
 - Extract United States Governmental Organizational Hierarchies

2. TerraFly

Geospatial Applications Suite
Developed and Maintained by
The High Performance Database Research Center
(HPDRC)
Florida International University (FIU)

FIU-HPDRC Expertise

- Database aspects:
 - Data visualization
 - Spatial databases
 - Internet-distributed heterogeneous databases
 - Database design methodologies
 - Information analysis

TerraFly

- Geospatial mapping solution
- Web-Based
- Customized to Industry needs
- Drill down to local information

TerraFly

GIS Solutions Based on New Generation Technology

- Platform
 - GIS-like Internet visualization
 - Open architecture, GIS-oriented API provider
 - 40 TB database of aerial imagery and spatial data
 - NSF and NASA funded technology
- Service
 - Professionally customized to domain requirements
 - Comprehensive and expert service

Mapping Solutions

Customized to industry needs. Sample applications:

- The **Hydrology** application shows the mean water level over time over water bodies
- The **Real Estate** application facilitates visualization of listings and allows complex queries via user-friendly interface.

Hydrology Application

Average of Surrounding Stations' Mean Daily Stage for Selected Water Body.

The screenshot displays a web-based hydrology application. At the top, there is an address search bar and date range filters (From 20070101 To 20090101 Interval 1 Day). The main area is divided into a map on the left and a data panel on the right. The map shows a satellite view of a region with numerous green triangles representing water body stations. A callout points to these as 'Selectable Lakes'. Another callout points to a cluster of red triangles around a lake as 'Surrounding water body stations'. The data panel on the right shows a line graph titled 'Average of Surrounding Stations' Mean Daily Stage for Selected Water Body.' with a y-axis labeled 'Ft,NGVD29' ranging from 9 to 13. Below the graph is a table of stage data for various dates. A callout points to the graph and table as 'Stage date Time diagram and data'. At the bottom of the data panel, there is a search bar for water bodies and a list of results.

Date	Stage (Ft,NGVD29)
1/2/07	12.1
1/3/07	12.08
1/4/07	12.03
1/5/07	12.03
1/6/07	12.04
1/7/07	12.04
1/8/07	11.95
1/9/07	11.77
1/10/07	11.76
1/11/07	11.77
1/12/07	11.76

Real Estate

The screenshot displays the RAMB real estate website interface. At the top, there is a search bar and navigation links for 'Go to Map', 'Go to Database', and 'Help'. Below this is a filter section with dropdown menus for 'Select a Type' (set to 'All types') and 'Price or Rent' (set to '0' and '6000000'). Other filters include 'Bedrooms' (0-8), 'Square Feet' (0-8000), 'Acres' (0-5), and 'Keywords'. The main area features a satellite map of a coastal area with various property listings overlaid. A detailed information window is open over one listing, showing a photo of a building and text: '\$1.5M 3 bedroom 3 bathroom 2399 s/f CONDO at 226 OCEAN DR # 5B/5C built in 2003 in ocean place'. To the right of the map is a list of property listings, each with a small image, price, and details. A legend on the right side of the map allows users to toggle various map features like roads, cities, and services.

2. Solving Spatial Problems in MapReduce

- R-Tree Index Construction
- Aerial Image Processing
- Midas Government Domain Application

MapReduce (MR) R-Tree Construction

- R-Tree Bulk-Construction
 - Every object o in database D has two attributes:
 - $o.id$ - the object's unique identifier.
 - $o.P$ - the object's location in some spatial domain.
 - The goal is to build an R-Tree index on D .
- MapReduce Algorithm
 1. Database partitioning function computation (**MR**).
 2. A small R-Tree is created for each partition (**MR**).
 3. The small R-Trees are merged into the final R-Tree.

Phase 1 – Partitioning Function

- Goal: compute f to assign objects of D into one of R possible partitions s.t.:
 - R (ideally) equally-sized partitions are generated (minimal variance is acceptable).
 - Objects close in the spatial domain are placed within the same partition.
- Proposed solution:
 - Use *Z-order* space-filling curve to map spatial coordinate *samples* (3%) into an sorted *sequence*.
 - Collect splitting points that partition the *sequence* in R ranges.

Phase 1 – Partitioning Function

Phase 1: Partitioning Function Computation

Map and Reduce inputs/outputs in computing partitioning function f .

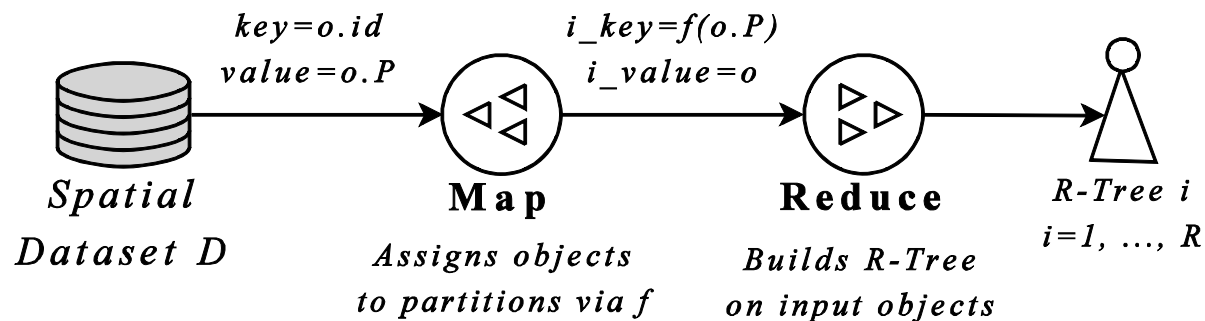

Function	Input: (Key, Value)	Output: (Key, Value)
<i>Map</i>	$(o.id, o.P)$	$(C, U(o.P))$
<i>Reduce</i>	$(C, \text{list}(u_i, i=1, \dots, L))$	S'

Where:

- o is an spatial object in the database.
- C which is a constant that helps in sending Mappers' outputs to a single Reducer.
- U is a space-filling curve, e.g. Z-order value.
- S' is an array containing $R-1$ splitting points.

Phase 2 - R-Tree Construction in MR

Phase 2: R-Tree Construction

MapReduce functions in constructing R-Trees.

Function	Input: (Key, Value)	Output: (Key, Value)
<i>Map</i>	$(o.id, o.P)$	$(f(o.P), o)$
<i>Reduce</i>	$(f(o.P), list(o_i, i=1, \dots, A))$	<i>tree.root</i>

Where:

- o is an spatial object in the database.
- f is the partitioning function computed in Phase 1.
- *Tree.root* is the R-Tree root node.

Phase 3 - R-Tree Consolidation

- Sequential process

Phase 3: *R-Tree Consolidation*

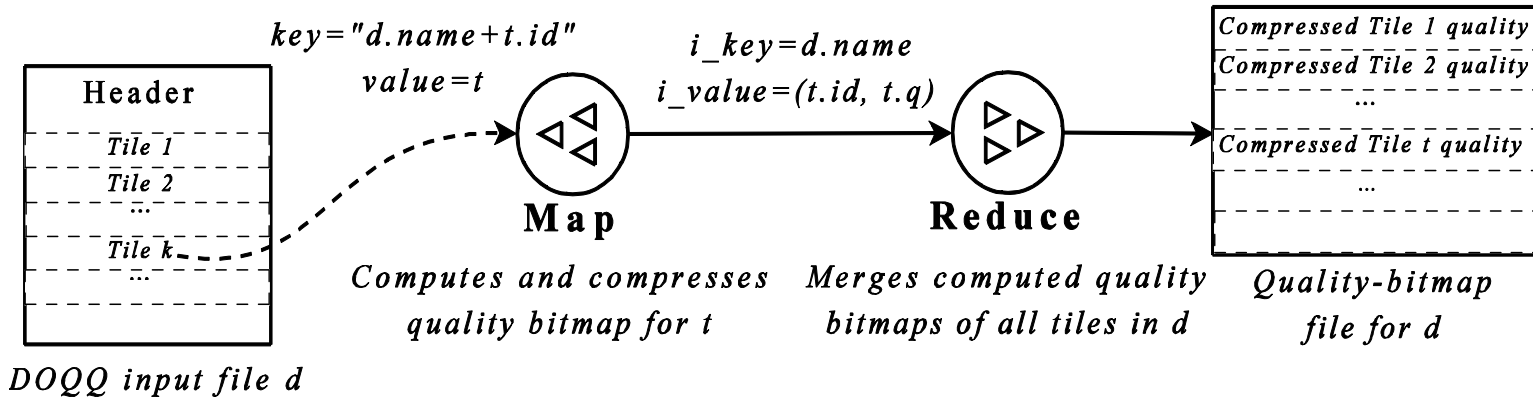

Aerial Image Processing

- R-Tree Index Construction
- **Aerial Image Processing**
- Midas Government Domain Application

Image Processing in MapReduce

- Aerial Image Quality Computation
 - Let d be an orthorectified aerial photography (DOQQ) file and t be a tile inside d , $d.name$ is d 's file name and $t.q$ is the quality information of tile t .
 - The goal is to compute a quality bitmap for d .
- MapReduce Algorithm
 - A customized *InputFormatter* partitions each DOQQ file d into several splits containing multiple tiles.
 - The Mappers compute the quality bitmap for each tile inside a split.
 - The Reducers merge all the bitmaps that belongs to a file d and write them to an output file.

Image Processing in MapReduce

Input and output of map and reduce functions

Function	Input: (Key, Value)	Output: (Key, Value)
<i>Map</i>	$(d.name+t.id, t)$	$(d.name, (t.id, t.q))$
<i>Reduce</i>	$(d.name, list(t.id, t.q))$	<i>Quality-bitmap of d</i>

Where:

- d is a DOQQ file.
- t is a tile in d .
- $t.q$ is the quality bitmap of t .

Midas Government Domain Application

- R-Tree Index Construction
- Aerial Image Processing
- **Midas Government Domain Application**

Linking USASpending.gov with OMB Earmarks

- Organizational/agency hierarchy must be established in order to properly attribute spending and earmark appropriation
- Midas Earmark records do not contain explicit agency information but, web records do.
- Midas Earmark records contain a 6 digit TAS - Treasury Account Symbol
 - First 2 digits = Agency
 - Last 4 digits = Account

+

Linking USAspending.gov with OMB Earmarks

- Common attributes for linking:
 - Congressional Districts
 - Treasury Account Symbols (TAS)
- We were able to extract semantic agency information from OMB Earmarks we can facilitate linkage.
- This allowed us to obtain finer grained results and use FPDS codes and hierarchical information found in NIST SP 800-87.

Example Queries:

- What percentage of Defense Department spending comes from Earmarks?
- What type of account does the Department of Agriculture spend the least from?
- Are there any vendors who do the majority of their work outside of their own congressional district?
- What percentage of the Department of the Interior's spending goes towards food and food services?
- Is there a congressman who sponsors bills that lead to a particular kind of spending?
 - I.e. Congressman Smith sponsored 100 million in earmarks, of which 90% went to agencies who's primary function is related to national defense.

3. Experimental Results

Experimental Results: Setting

- Data Set

Table 4. Spatial data sets used in experiments*.

Problem	Data set	Objects	Data size (GB)	Description
<i>R-Tree</i>	<i>FLD</i>	<i>11.4 M</i>	5	Points of properties in the state of Florida.
	<i>YPD</i>	<i>37 M</i>	5.3	Yellow pages directory of points of businesses mostly in the United States but also in other countries.
<i>Image Quality</i>	<i>Miami-Dade</i>	<i>482 files</i>	52	Aerial imagery of Miami-Dade county, FL (3-inch resolution)

* Data sets supplied by the *High Performance Database Research Center* at Florida International University

- Environment

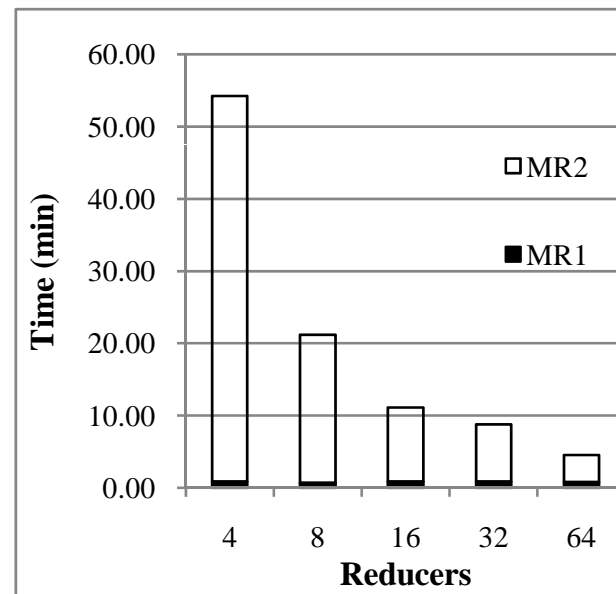

- The cluster was provided by the Google and IBM *Academic Cluster Computing Initiative*.
- The cluster contains around 480 computers running Hadoop - open source MapReduce.

Experimental Results: R-Tree

- R-Tree Construction Performance Metrics

(a) *FLD* data set

(b) *YPD* data set

MapReduce job completion times for various number of reducers in phase-2 (MR2).

Experimental Results: R-Tree

5. Conclusion

Conclusion

- We employed the MapReduce model to solve two spatial problems on the Google&IBM cluster:

- (a) Bulk-construction of R-Trees and
- (b) Aerial image quality computation

And a document processing for linkage extraction project:

- (b) MIDAS Government domain application
- MapReduce can dramatically improve task completion times. Our experiments show close to linear scalability.
- Our experience in this work shows MapReduce has the potential to be applicable to more complex spatial problems.
